

Good housekeeping practices to address stormwater pollution

1. Manage exposed soil

- Erosion control
 - Keep stockpiled material off City of Calgary roadways.
 - Material stockpiles should be covered with an appropriate erosion control at the end of every day. Inactive stockpiles must be covered after 30 days.
- Sediment control
 - Stockpiles must be upstream of trenches or holes. Use perimeter protection where needed.
 - Take appropriate steps to control mud-tracking.
- Dust control
 - Use water trucks and street sweepers to control dust on site.

2. Manage stormwater

- Route stormwater around worksites.
- Site water that has been collected and is clean can be disposed of to the stormwater system by applying for a Drainage Permit or Notification. Call 311 to request your permit.
- Do not install inlet protection on City of Calgary inlets without signed approval from The City.

3. Prevent and prepare for spills

- Use primary and secondary containment measures for any pollutant sources on site.
- Have the appropriate spill kit on site.
- Report spills to:
 - **9-1-1** if the spill cannot be controlled or presents an immediate risk to public health and safety.
 - **1-800-222-6514** (Alberta Environment and Parks) if the spill could or has entered the environment (air, land, water).
 - **311** if the spill has entered City of Calgary property (roads, gutter, storm infrastructure, parks, etc.).

4. Inspect, maintain and document

- Inspect controls every seven days and after every rain or snowmelt event. Vehicles and machinery should be inspected daily for leaks.
- Repair or replace damaged controls.
- Document all inspections and corrective actions.
